

IntrinG Auditable AI

One-page platform summary (repo-evidenced)

What It Is

IntrinG Auditable AI is a FastAPI + React platform that registers AI systems, ingests logs, runs governance evaluations, and produces reports (including PDF exports) using KPMG Trusted AI-style principles.

Who It's For

Primary persona: AI auditor / governance team member who needs repeatable evidence, risk scoring, and reviewable audit outputs for AI systems.

What It Does (Key Features)

- JWT-based auth (register, login, profile fetch/update).
- Register AI systems with connector metadata (type, endpoint, headers).
- Ingest CSV/Excel logs through SDCC pipeline with schema/column quality checks.
- Evaluate systems into principle scores, risk level, findings, and framework alignment flags.
- Run black-box audits in API or UI mode, with audit history and detailed retrieval.
- Generate and download report PDFs from stored report IDs.
- Chrome extension endpoint scores captured probe responses from browser audits.

How It Works (Repo-Evidenced)

- React (Vite) frontend calls backend at `http://localhost:8000` via axios service.
- FastAPI app mounts auth, AI eval/ingest, blackbox, reports, and extension routers.
- MongoDB collections store users, AI systems, SDCC results, reports, blackbox audits.
- Data flow: Register AI -> Ingest logs -> Evaluate -> Store report -> View/Download PDF.
- Optional flow: Chrome extension collects probes -> `/api/v1/audit/score` computes results.

How To Run (Minimal)

- Backend deps: `pip install -r backend/requirements.txt`
- Set env vars used by code: `MONGO_URI` and `SECRET_KEY`.
- Start backend: `uvicorn app.main:app --reload` (from backend/).
- Start frontend: `npm install && npm run dev` (from frontend/).
- Open Vite URL (default `localhost:5173`) and sign in.
- Not found in repo: one canonical root-level setup guide/example .env file.
